

Cold Weather Procedures - Pre-Dispatch

The on-board coffeemaker may be plugged in when in station. The plug is located next to the action wall at the attendant's seat. Plug into the shore power outlet and then check to make sure the coffee maker is plugged in. The coffee maker is located on compartment 3 (rear compartment on the roadside of the apparatus. After approximately 20 minutes the green light should come on, indicating that the coffeemaker is ready for brewing.)

When the coffeemaker is plugged replenish any evaporated water with a cup of water daily,

1. Place the filter basket into place.
2. Place an empty cup under the coffee filter basket.
3. Pour one cup of water into the top water input.
4. A stream of water should flow into the cup. If water does not flow, add water to the input until hot water flows.
5. When the flow stops. Discard the cup and water.

Leave the compartment door open while the coffeemaker is plugged in.
